Portuguese

CAREER OBJECTIVE

Computer Engineering student at UNIVASF seeking a software development internship. I program in C, Java and Python, with projects in data structures, search algorithms, object-oriented design and game development.

PROJECTS

2026

Eixo 0 (barebones version) | Personal project | Java 17 and Maven

- Simplified version of my game Eixo 0, written to practice object-oriented design: **27 classes** organized into world and character packages.
- Abstract classes and interfaces for characters, enemies (melee, flying and long-range), weapons, and abilities with energy cost and cooldown.
- Inventory, level and experience system, and a room map indexed by id with a LinkedHashMap.

2026

prolog-simulator-c | Algorithms and Data Structures | UNIVASF

- Built a Prolog-style interpreter with a parser for facts and rules, predicates indexed in a binary search tree and clauses stored in linked lists.
- Resolution engine with unification, variable renaming and backtracking that finds **every solution** to a query.
- Knowledge bases loaded from .txt files. Pair project with Caio Benevides.

2026

maze-solver-bfs | Algorithms and Data Structures | UNIVASF

- Implemented breadth-first search with a sequential queue plus visited and parent matrices to rebuild **the shortest path** to the exit.
- Step-by-step terminal animation with ANSI colors; loads 10 mazes from text files. Pair project with Caio Benevides.

2025

raylib-farm | Algorithms and Programming | UNIVASF

- Built a 2D farming game in C with raylib: scrollable shop, inventory, time-based crop growth on a grid, and an XP and level system.
- Shipped a browser version (WebAssembly) and Windows and Linux builds that **don't require installing raylib**.
- While revising the project, fixed 4 bugs, including one that **allowed infinite money**.

OTHER PROJECTS

ELECTROTECHNICS

EMBEDDED IRRIGATION SIMULATOR IN C | UNIVASF, with Hiago de Oliveira Lima and Rafaela Nunes Albuquerque
